

## Linked Lists Part 2

---

---

---

---

---

---

---

### What we did:

- Concept Intro
- Insert at head
- Linked list traversal
- Insert at tail

---

---

---

---

---

---

---

### What we'll do today:

- Inserting anywhere in LL
- Removing from LL
- In the middle
- With only one item in a list

---

---

---

---

---

---

---

## Recap

### A linked list is a chain of nodes

- A node is a struct, usually allocated on the heap
- It contains a payload (some data), and a pointer to another node

---

---

---

---

---

---

---

## A node declaration in C

```
struct node {  
    int data;  
    struct node *next;  
};
```

---

---

---

---

---

---

---

## Visualisation of linked list

---

---

---

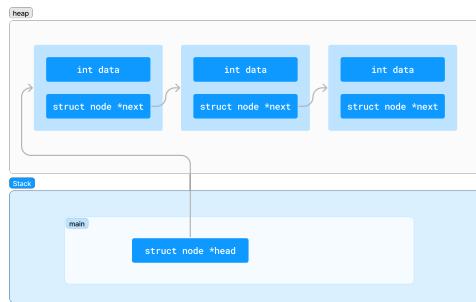

---

---

---

---

## Need a reference to the linked list

---

---

---

---

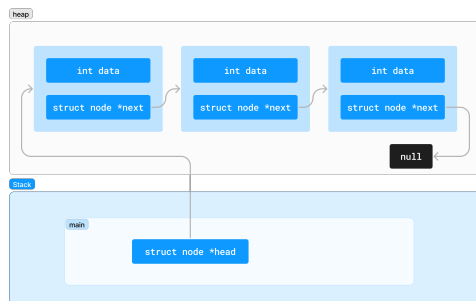

---

---

---

---

## How do we know we're at the end of the linked list?

---

---

---

---

---

---

---

---

## To create a linked list, we:

- Define a struct for a node
- A pointer to keep track of where the start of the list
- A way to create a node and then connect it into our list

---

---

---

---

---

---

---

---

**Demo?**

---

---

---

---

---

---

---

**Today's goals:**

- insert\_at\_index
- delete\_node\_at\_index
- remove\_tail
- size\_of\_linked\_list

---

---

---

---

---

---

---

**Inserting in the middle of  
a linked list**

1. Discuss
2. Whiteboard
3. Implement

---

---

---

---

---

---

---

## Deleting in the middle of a linked list

1. Discuss
2. Whiteboard
3. Implement

---

---

---

---

---

---

---
